

Contraindication List

People with certain medical conditions or other factors should avoid or postpone cavitation, including:

- **Pregnancy and breastfeeding**
- **Cancer, HIV/AIDS, or other serious infections**
- **Kidney, liver, or heart disease**
- **Blood clotting disorders**
- **Diabetes Type 1 or osteoporosis**
- **Pacemakers or other electronic implants**
- **Uncontrolled high blood pressure**
- **Autoimmune diseases like lupus**
- **Skin conditions like eczema, psoriasis, or dermatitis**
- **Open wounds or sores in the treatment area**

Cavitation is a non-invasive, FDA-approved procedure that uses ultrasound to reduce fat. It's generally safe and well-tolerated, but the heat it generates can irritate sensitive skin.
